

CHAPTER VI

CLOSING

This chapter contains conclusions from the design of the layout and facilities of the production house and suggestions for further research.

6.1 Conclusion

This study resulted in a layout design and production house facilities with nine rooms consisting of a production room, secondary packaging room, appliance washing room, changing room, warehouse, storage, toilet, weighing room, and laboratory. The production house is designed by applying the principles of layout preparation and GMP rules. GMP rules have been applied in the design of workstations and rooms as well as the arrangement of all rooms. So that the resulting production house area of 50 m². It has fulfilled the available land area for the construction of production houses.

6.2 Suggestions

Basically, this research went well. However, the researcher would like to propose some suggestions that can be useful for further research. The suggestions that researchers put forward are as follows:

1. Construction of production houses can be made multi-story so that additional facilities and supporting room in production activities can be added
2. The size of each room should be given allowance outside the remaining area after arrangement
3. The room is designed to have an emergency exit
