

## IV. CONCLUSIONS AND SUGGESTIONS

### 5.1. Conclusions

Based on the study that has been conducted, the following conclusion has been reached:

1. The specimens of *O. hannah* from several Indonesian Islands cannot be distinguished morphologically. The only meristic traits that differ are the ventral scales, post-ocular scales, interparietal scales, sub-caudal scales, and supra labial scales.
2. The taxonomic position of *O. hannah* populations from various Indonesian Islands is still the same.

### 5.2. Recommendations

Further research is needed at the molecular stage and by using a larger number of individuals to obtain more accurate data.
