COVID-19 adalah wabah penyakit yang sulit untuk dikendalikan sehingga membuat angka mortalitas dan morbiditasnya tinggi. Kasus COVID-19 di Indonesia mencapai angka tertinggi pada Juni-Agustus 2021 sehingga banyak kebijakan yang dilakukan pemerintah untuk menanggulangi permasalahan ini. Tujuan dari penelitian ini yaitu mengetahui karakteristik pasien yang terkonfirmasi *Coronavirus Disease 2019* (COVID-19) di RSUP. M. Djamil Padang Periode Juni-Agustus 2021.

Jenis penelitian ini adalah deskriptif dengan jumlah sampel 306 pasien terkonfirmasi COVID-19 yang dirawat inap. Penelitian ini dilakukan pada bulan Oktober sampai Desember 2021 di RSUP Dr. M. Djamil Padang. Data dikumpulkan dan diolah dengan menggunakan teknik *consecutive sampling*. Hasil penelitian ini didapatkan bahwa perempuan (56.86%) lebih banyak terkonfirmasi positif COVID-19 dibanding laki-laki dan sering ditemukan pada rentang usia  $\geq 56-65$  tahun. Penyakit bawaan terbanyak yang dibawa pasien adalah Hipertensi (35.62%), Lama rawatan pasien yang dirawat inap rata-rata  $< 15$  hari (77.2%) dengan hasil rawatan terbanyak yaitu meninggal (36.2%).

Kesimpulan dan saran berdasarkan penelitian ini didapatkan bahwa lansia lebih berisiko terinfeksi COVID-19 juga mengalami perburukan kondisi dan dengan penelitian ini diharapkan seluruh masyarakat tetap ketat dalam menjaga protokol kesehatan dan mengikuti vaksinasi.
