ABSTRAK

Tujuan

Prevalensi kasus stunting di wilayah kerja Puskesmas Batu Hampar sebesar 10,7% dan cakupan D/S yang sangat rendah yaitu 45,7% dari target 88%. Keberhasilan pencegahan stunting salah satunya terletak pada peran kader Posyandu. Penelitian ini bertujuan untuk mengetahui faktor yang berhubungan dengan peran kader Posyandu dalam pencegahan stunting di wilayah kerja Puskesmas Batu Hampar tahun 2023.

Metode

Penelitian ini penelitian kuantitatif, pada bulan Januari-Juni 2023, rancangan penelitian studi *cross sectional*, populasi 125 kader di wilayah kerja Puskesmas Batu Hampar, dan sampel 61 kader. Analisis data dilakukan secara univariat hingga multivariat.

Hasil

Hasil penelitian menunjukkan umur ($\rho = 0,004$), masa kerja ($\rho = 0,044$), pengetahuan ($\rho = 0,015$), motivasi ($\rho = 0,027$) peran tenaga kesehatan ($\rho = 0,015$), dan insentif ($\rho = 0,015$) berhubungan dengan peran kader Posyandu dalam pencegahan stunting. Pengetahuan paling dominan memengaruhi peran kader dalam pencegahan stunting (POR = 9,046).

Kesimpulan

Variabel yang paling dominan berhubungan adalah pengetahuan. Umur, masa kerja, pengetahuan, motivasi, peran tenaga kesehatan, dan insentif berhubungan dengan peran kader Posyandu dalam pencegahan stunting. Diharapkan kader bisa aktif mencari informasi berupa bahan bacaan, bertanya, maupun bertukar pikiran antar kader mengenai pencegahan stunting. Puskemas dan Pemerintah Nagari perlu memfasilitasi ketersediaan informasi bagi kader dan mengadakan pelatihan.

FACTORS ASSOCIATED WITH THE ROLE OF POSYANDU CADRES IN PREVENTING STUNTING IN THE REGION BATU HAMPAR HEALTH CENTER IN 2023

xiii + 142 pages, 44 tables, 3 figures, 8 attachments

ABSTRACT

Objective

The prevalence of stunting cases in the Batu Hampar Health Center working area is 10.7% and very low D/S coverage of 45.7% of the 88% target. The success of stunting prevention lies in the role of Posyandu cadres. This study aims to determine the factors associated with the role of Posyandu cadres in preventing stunting in the Batu Hampar Health Center working area in 2023.

Methods

This research is quantitative research, in January-June 2023, cross sectional study research design, population 125 cadres in the Batu Hampar Puskesmas working area, and a sample of 61 cadres. Data analysis was carried out univariate to multivariate.

Results

The results showed that age ($\rho = 0,004$), tenure ($\rho = 0,044$), knowledge ($\rho = 0.015$), motivation ($\rho = 0,027$) the role of health workers ($\rho = 0,015$), and incentives ($\rho = 0,015$) were associated with the role of Posyandu cadres in stunting prevention. Knowledge most dominantly influences the role of cadres in stunting prevention (POR = 9,046).

Conclusion

The most dominant variable associated is knowledge. Age, tenure, knowledge, motivation, the role of health workers, and incentives are related to the role of Posyandu cadres in stunting prevention. It is hoped that cadres can actively seek information in the form of reading materials, ask questions, and exchange ideas between cadres regarding stunting prevention. Puskesmas and the Nagari Government need to facilitate the availability of information for cadres and organize training.
