

CHAPTER V. CONCLUSION AND SUGGESTION

5.1 Conclusion

Based on the results of the research that has been carried out, the following conclusions are obtained:

In feed maize distributed in feed stores in Padang City, West Sumatra originating from three locations namely Pariaman, Pesisir, Pasaman funds that have been isolated obtained 9 different *Aspergillus* mold isolates namely *Aspergillus aculeatus*, *Aspergillus flavus*, *Aspergillus oryzae*, *Aspergillus ruber*, *Aspergillus tamarii*, *Aspergillus tamarii*, *Aspergillus versicolor*, *Aspergillus wentii*.

5.2 Suggestions

Based on the results of the research that has been done, it is recommended to be the baseline for one of the steps to improve the maize management process in the post-harvest and storage phase to reduce the contamination of maize by *Aspergillus*.
