## ABSTRACT

*Employability* is the skills a person has to get a job, maintain a job, and be able to adapt to the work environment. This research was conducted to find out how training affects employability in people with disabilities. The data used is secondary data derived from the August 2020 National Labor Force Survey. The total observation units used in this study were 3.526 individuals. The analysis technique used in this research is logistic regression analysis. The results showed that people with disabilities who had participated in training had greater employability among persons with disabilities who had never participated in training.

Keyword: *Employability; Training; Analisi Regresi Logistic*
