

## CHAPTER VII

### CONCLUSIONS

This chapter consists of the conclusions of the research and the suggestions given to the next research.

#### 7.1 Conclusions

The conclusion of the research is after designing and manufacturing then the experiment is conducted. Based on conducted experiments, before using the squeeze tool of honey time required to extortion about 75 minutes to 5 kg of honeycomb, while after using machine can reduce the processing time to 15 minutes for 5kg beehive; and the results of the experiment, there is improvement posture work out which with the use of honey extortion no longer needs to repair work posture.

#### 7.2 Suggestion

The suggestion given by researcher is the scopes of research should be developed. Other workstations should be given attention to improve such as for the next research is recommended not only do the design based on the consideration posture and processing time, but also consider the cost of mass production.
