

CHAPTER 4

CONCLUSION

Analyzing ideationalmetafunction of a text means to answers some questions: who appears in the text? What is happening, and where, when, and how is that happening. The answer to those questions is in the evaluation of transitivity related to concepts of process, participant and circumstance and it also be the research questions of this study. The conclusions of the answers of those questions are:

1. The characterized Process Type of the president Donald John Trump's Presidential Inauguration Speech is Material Process. It reaches 59,79 % as the highest frequency of occurrence in the speech. The ideationalmeaning that realized by materialprocess as the dominant type of Process found in the speech is the president used a variety of material process choices to indicate the physical activity will be taken to change and to fix America and to represent the physical roles of other parties that have been the reason why America needs to be fixed.
2. The characterized participantfunctions of the president Donald John Trump's presidential inaugurationspeech is the participants of materialprocess named actor and goal. They are mentioned 151 times and take 53,55% of the total Participant. The ideationalmeaning realized by actor and goal as the most dominant participantfunctions that appear in the speech is the president, encourage all of the people of America to unite to take actions. The president, the government and the public act materially on

another participant volitionally to reach the goal which is to make America great again.

3. The characterized Circumstantial Element of the president Donald John Trump's presidential inauguration speech is location, for both sub-type place and time. There are 27 circumstances of place-location found in the speech and 15 circumstances of time-location found in the speech. The circumstances of place and time indicate that president Trump's concerns on the domestic issues rather than building cooperation with other countries and the action will be taken immediately.

The study has resulted in some beneficial findings. The research questions have been answered. Drawing on the framework of Halliday's Systemic Functional Linguistics as the theoretical framework for this study has been suitable for providing the conception for analysis that has met the research objectives. Transitivity analysis gives the representation of the intentions of president Donald John Trump which is his concern is mainly about how to start making changes to America to be better than the previous administration. The representation of president Trump's views could be realized through different Process Types, Participant Roles and Circumstantial Element. It takes into account of the paradigmatic conception of language where each choice made by him plays an essential function.

The current study has rendered an investigation on the construction of president Donald John Trump's inauguration speech. It has been achieved through the analysis of Transitivity element which is the realization of Ideational metafunction. Therefore, this study can open a window for further studies. The

current data can also be employed to analyze the other two metafunctions; interpersonal and textual which may depict another value of meaning that is how the messages of speeches organized can be uncovered.
