ABSTRAK

PSBH merupakan salah satu program yang dapat digunakan untuk membantu pengembangan *problem solving* yang secara langsung memberikan manfaat bagi banyak orang. RSUD Siti Aisyah Lubuklinggau mencoba melakukan pelaksanaan proses pendokumentasian asuhan keperawatan dalam upaya peningkatan mutu pelayanan rawat inap dengan menyiapkan format baku instrument berupa cek list/formulir, namun peneliti masih menemukan rata-rata 4-5 status pasien yang pendokumentasian pasien masuk rumah sakit sampai pasien pulang belum lengkap terisi. Penelitian ini bertujuan untuk mengetahui pengaruh penerapan metode *problem solving for better health* terhadap pendokumentasian asuhan keperawatan dan dilakukan pada tanggal 7 Februari 2018 s/d 15 Maret 2018 di Ruang Rawat Inap RSUD Siti Aisyah Lubuklinggau dengan jenis penelitian kuantitatif, desain *quasi eksperiment*, pendekatan *two group pre and post test* dengan uji statistik T Dependen dan T Independen. Populasi dalam penelitian adalah seluruh perawat pelaksana yang bekerja di Ruang Rawat Inap RSUD Siti Aisyah Lubuk Linggau tahun 2018 dengan jumlah 108 orang, sampel masing-masing berjumlah 18 orang (kelompok intervensi dan kontrol). Hasil penelitian didapati adanya pengaruh sebelum dan sesudah dilakukan penerapan metode *problem solving for better health* terhadap pendokumentasian asuhan keperawatan di Ruang Rawat Inap RSUD Siti Aisyah Lubuklinggau (pada kelompok intervensi dan kontrol) dengan *p value* 0,002 pada kelompok intervensi dan 0,007 pada kelompok kontrol. Diharapkan agar pihak manajerial rumah sakit lebih memperhatikan kinerja perawat pelaksana khususnya dalam pendokumentasian asuhan keperawatan dengan cara mengadakan sosialisasi dan memotivasi pengisian dokumentasi asuhan keperawatan, mengadakan pengawasan secara rutin, memberikan reward bagi perawat yang telah melakukan pendokumentasian dengan lengkap dan memberikan *punishment* bagi perawat yang lalai.

THE EFFECT OF THE APPLICATION OF PROBLEM SOLVING FOR BETTER HEALTH METHOD ON NURSING CARE DOCUMENTATION IN-PATIENT WARDS OF SITI AISYAH HOPITAL LUBUKLINGGAU

xviii + 93 page + 5 table + 11 attachment + 2 scheme

ABSTRACT

Nursing documentation is a proof of professional nursing service that includes assessment, nursing diagnosis, nursing planning, action and evaluation in order to describe the overall health condition of the patient. Though, it is found the amount of documentation of nursing care that is less maximum. This study is aimed to determine the effect of the application of problem solving for better health method on nursing care documentation in-patient wards of Siti Aisyah Hopital Lubuklinggau in 2018 with quantitative research, quasi experiment design with two group pre and post test approach. The population in this study were all nurses who worked in 8 (eight) in-patient wards of Siti Aisyah Hospital Lubuk Linggau in 2018 with the number of 108 people, each sample is amounted to 18 people (intervention and control group). The result of this research which is the mean of pre test score in intervention group is 60,89 while the average pre test score in the control group was 60.44. The average post test score in the intervention group is 72.11 while the average post test score in the control group is 62.33. The result shows that there is an influence of problem solving for better health method on nursing care documentation at in-patient wards of Siti Aisyah Hospital Lubuklinggau (in intervention and control group) with p value 0,002 in intervention group and 0,007 in control group. It is expected that the hospital can implement and always involve the nurses into the PSBH activities to solve every problem encountered in the hospital (not only the problem of nursing care documentation), so that all nurses could know and be skilled in doing problem solving faced in hospital.
