The Effect Of The Kangaroo Mother Care On Body Temperature, Heart Rate And Oxygen Saturation Of Low Birth Weight Infants In Pariaman Hospital In 2018

ABSTRAK

UNIVERSITAS ANDALAS

The main cause of neonatal mortality is low birth weight especially in developing countries. Kangaroo mother care is one of an effective care for low birth weight infants. The purpose of the study was to identify the effect of the kangaroo mother care on body temperature, heart rate and oxygen saturation of low birth weight infants in Pariaman Hospital. The study design was one-group pre and post test with accidental sampling technique. The research was conducted on 14 babies with low birth weight (1200-2000 grams) in Pariaman Hospital with the implementation of research in the November - December 2018. Collection of data through observation sheets. Data analysis included univariate analysis for frequency distribution and bivariate analyzes to test paired sample t-test to determine the effect of the independent variable on the dependent. The result of study was found that there were significant differences between before and after kangaroo mother care intervention on body temperature, heart rate and oxygen saturation (p value 0,000). Kangaroo mother care can be used as a nursing intervention for the mother in the care of low birth weight infants independently

Keyword : kangaroo mother care, low birth weight infants, body temperature, heart rate and oxygen saturation
