The Application of Various Crude Tannin Extraction Methods from Mangium Bark (*Acacia Mangium*)

Desta Yuda Putra, Anwar Kasim, Diana Silvy

ABSTRACT

This study aims to determine the application of several extraction methods to crude tannin extracts obtained from mangium bark extraction. The method of this research using exploratory method by extracting mangium peel powder with several different extraction methods on laboratory scale that is ; maceration, extraction using soxhlet, extraction using ultrasonic bath tool, reflux, and digestion/kinetic maceration. The extraction result test includes the calculation of the yield, tannin content analysis, and the solubility of tannin in water analysis. The result of this study indicate that different method used on tannin extraction from mangium bark peels produces different yield and crude tannin extract qualities. The highest yield is generated by extraction method using ultrasonic bath tool that is equal to 29,68 %.

Keyword : acacia mangium, extraction method, crude tannin, tannin yield
