Hubungan Efikasi Diri dan Pengetahuan dengan Kesiapan Mahasiswa Profesi
Ners dalam Melakukan Resusitasi Jantung Paru (RJP) di
RSUP Dr. M. Djamil Padang Tahun 2024

ABSTRAK

Mahasiswa profesi ners dituntut untuk mencapai kompetensi keterampilan pemberian RJP pada tingkat mandiri. Namun, kondisi di lapangan menunjukkan bahwa masih rendahnya kesiapan mahasiswa profesi ners untuk melakukan RJP yang nantinya akan berdampak pada kurangnya pengalaman klinik selama praktik. Kesiapan melakukan RJP dapat dibangun oleh beberapa faktor seperti efikasi diri dan pengetahuan. Tujuan penelitian ini guna mengetahui hubungan antara efikasi diri dan pengetahuan dengan kesiapan mahasiswa profesi ners dalam melakukan Resusitasi Jantung Paru (RJP) di RSUP Dr. M. Djamil Padang. Jenis penelitian yang digunakan yakni kuantitatif korelasional dengan desain *cross sectional*. Teknik pengambilan sampel yakni *purposive sampling* dengan 67 responden. Data dihimpun melalui pengisian kuesioner. Pengolahan data menggunakan analisis univariat melalui distribusi frekuensi beserta analisis bivariat melalui uji *Fisher's Exact Test* ($p\text{-value} < 0,05$). Hasil didapatkan 85.1% responden memiliki efikasi diri tinggi, 52.2% responden memiliki pengetahuan cukup-kurang, 61.2% responden memiliki kesiapan diri cukup. Terdapat hubungan antara efikasi diri dan pengetahuan dengan kesiapan diri melakukan RJP dengan nilai $p\text{-value} < 0,001$ serta 0,015. Efikasi diri serta pengetahuan mahasiswa terkait RJP perlu ditingkatkan melalui aktif ikut serta dalam simulasi/pelatihan bantuan hidup dasar serta penyegaran materi berkala untuk membangun kesiapan diri memberikan RJP berkualitas yang menjadi kompetensi yang harus dicapai mahasiswa.

Kata Kunci : Resusitasi Jantung Paru, Efikasi Diri, Pengetahuan,
Kesiapan, Mahasiswa Profesi Ners

*The Relationship between Self-Efficacy and Knowledge with the Readiness of
Nursing Profession Students to Perform Cardiopulmonary Resuscitation
(CPR) at Dr. M. Djamil Padang Hospital in 2024*

ABSTRACT

Nursing profession students are required to achieve competence in the skills of providing CPR at an independent level. However, conditions in the field show that the readiness of professional nursing students to carry out CPR is still low, which will result in a lack of clinical experience during practice. Readiness to carry out RJP can be built by several factors such as self-efficacy and knowledge. This research aims to determine the correlation between self-efficacy and knowledge with the readiness of nursing profession students to perform cardiopulmonary resuscitation (CPR) at Dr. M. Djamil Padang Hospital. In this type of study, a cross-sectional design was utilized to measure quantitative correlation. The sample consists of 67 respondents selected through purposive sampling. Questionnaires were handed in, in order to gather data. Fisher's Exact Test (p -value <0.05) was used for bivariate analysis and frequency distribution was utilized for univariate analysis of the data. The outcome indicates that 85.1% of respondents had high self-efficacy, 52.2% of respondents had moderate-low knowledge, and 61.2% of respondents had sufficient self-readiness. There is a correlation between self-efficacy and knowledge with self-readiness to perform CPR with a p -value of <0.001 and 0.015 . Students' self-efficacy and knowledge regarding CPR need to be improved through actively participating in basic life support simulations/training as well as periodic material refreshers to build their readiness to provide quality CPR which is a competency that students must achieve.
