

V. CONCLUSION

5.1. Conclusion

Conclusion base of the research that has been done is

1. The species of Egrets that present in the rice field are Large egrets (*Ardea alba*), Red herons (*Ardea purpurea*), Cattle egret (*Bubulcus ibis*), Silver egrets (*Egretta intermedia*), small egrets (*Egretta garzetta*), and Cinnamon Bittern (*Ixobrychus cinnamomeus*).
2. The base of the observation that has been conducted, all six species of an egret that found in rice field observed only in the preparation phase, where only one species found in the early time of vegetative phase which is Cattle egret (*Bubulcus ibis*), and no egrets found in both generative and post-harvest phase.
3. Egrets in the rice field found have an activity such as feeding, moving, resting, aggression and mixed-flock

5.2. Suggestion

There should be further research about behavior between each species of egrets and how cultivation phase affects it.
