Penerapan *Inter Professional Collaboration* (IPC) yang kurang baik di rumah sakit dengan pelayanan *multiple case* dan *single case* dapat mengakibatkan *medical error*, *nursing error* dan Kejadian Tidak Diharapkan (KTD). Penelitian ini bertujuan untuk mengetahui penerapan IPC oleh Profesional Pemberi Asuhan di Rumah Sakit Umum dan Rumah Sakit Khusus Jiwa Propinsi Jambi tahun 2019. Desain deskriptif komparatif, pendekatan *cross sectional study*. Populasi Perawat, Dokter, Apoteker dan Ahli Gizi di Rumah Sakit Umum 171 sampel, Rumah Sakit Jiwa 105 sampel. Pengambilan sampel dengan *random sampling* dan *total sampling*. Instrumen penelitian AITCS yang sudah dimodifikasi sesuai kebutuhan. Hasil penelitian *Chi-Square* didapati bahwa tidak adanya perbedaan yang signifikan antara penerapan IPC *partnership* di RSU dengan RSJ (*p value* 0,715), tidak ada perbedaan penerapan IPC *cooperation* di RSU dengan RSJ (*p value* 0,168), tidak ada perbedaan penerapan IPC *coordination* di RSU dengan RSJ (*p value* 0,839) dan tidak ada perbedaan penerapan IPC *shared decision-making* di RSU dengan RSJ (*p value* 0,734). Diharapkan pihak RSU dan RSJ agar dapat mengenalkan model, komponen dan proses IPC untuk di terapkan diruang rawat inap, melakukan kegiatan seminar atau pelatihan metode IPC dengan melibatkan berbagai profesi kesehatan sehingga IPC PPA dapat berjalan sebagaimana mestinya.

**ABSTRACT**

*The application of Inter Professional Collaboration (IPC) which is not good in the hospital with the service of multiple cases and single cases can result in medical errors, nursing errors and unexpected events. This study aimed to determine the application of IPC by Professional Caregivers at Public Hospital and Mental Hospital in Jambi in 2019. This study was conducted by using comparative descriptive design with cross sectional study approach. The population of this study was nurses, doctors, pharmacists and nutritionists from public hospitals and mental hospitals. 171 samples were taken from public hospital and 105 samples from mental hospital. The samples were chosen by random sampling and total sampling. The instrument of this study was AITCS which had been modified as needed. The result of Chi-Square found that (a) there was no significant difference between the application of partnership IPC at General Hospital and Mental Hospital (p value 0.715); (b) there was no difference in the application of cooperation IPC at General Hospital and Mental Hospital (p value 0.168); (c) there was no difference in the application of coordination IPC General Hospital and Mental Hospital (p value 0,839); and (d) there was no difference in the application of shared decision-making IPC at General Hospital and Mental Hospital (p value 0,734). It is expected that General Hospital and Mental Hospital can introduce the models, components and processes of IPC to be implemented in the inpatient rooms. Then General Hospital and Mental Hospital should hold seminars or IPC training methods by involving various health professions so that the IPC PPA can be administered as it should be.*
