

CHAPTER IV

CONCLUSION AND SUGGESTIONS

4.1. Conclusion

To conclude this study, the researcher has drawn a conclusion to summarise everything discussed in this research. The result of this research is drawn based on Morley's theories of Nominally Functioning Element and Context of Situation in his book *Syntax in Functional Grammar* (2000) and *Exploration in Functional Syntax* (2004). The finding shows a total of 1275 data points of nominally functioning elements found in the book *The Twits* by Roald Dahl. Among all the data results, the nominative subject was found to be the most dominant function element with a total of 931 data points. Joined by the direct object with 247 data points, the oblique object with 48 data points, the direct non-identifying complement with 29 data points, and the direct identifying complement with 20 data points.

As for the context of situation, the finding shows that the register categorized the book *The Twits* as a character-oriented narrative text that mainly discusses the daily life and traits of the two main characters, Mr. and Mrs. Twit. The book was delivered in written language with an informal and friendly tone between the narrator, as the storyteller, and the audience.

This result of the dominance of the nominative subject is supported by the fact that a narrative text, like the book *The Twits* by Roald Dahl, revolves around the involvement of the characters and their action. Moreover, it can also be attributed to its crucial role as the basic syntactic subject in the construction of clauses and sentences.

4.2. Suggestion

For future research, the author encourages those who are interested in researching the nominally functioning elements of clause structure and their relation to the context of situation to explore other types of literary work. The future study could also focus on analyzing different aspects or elements and using the newest and updated resources for the research.
