**ABSTRACT**

Urinary tract infections that mostly occur in children aged toddlers can be prevented by doing toilet training that is taught to children both by mothers and health workers by providing education that can change a person's behavior in the community. The purpose of this study was to determine the effect of toilet training education on the knowledge, attitudes, and actions of mothers in toddler age children in the working area of Aurduri Health Center in Jambi City. The population in this study were all mothers with children aged 18-36 months who were in the Aurduri Public Health Center, Jambi City. The samples of this study were 82 samples consisting of 41 interventions and 41 controls. The design of this study used a quasy experiment with a pre and post test with control group design with sampling technique by means of multi stage random sampling. By using questionnaires and observation sheets. The results of the Man Whitney test showed a significant influence on knowledge ( $p = 0,000$ ), attitudes ( $p = 0,000$ ), and actions ( $p = 0,000$ ). This health education is highly recommended for puskesmas especially in the field of health promotion to hold regular and scheduled health promotions to improve the ability of mothers to conduct toilet training for children.
