The differences of the Psychological Welfare of Adolescents Living In Orphanages with Adolescents Living with Parents in Padang City in 2019

xviii + 133 pages + 10 tables + 1 picture + 12 appendixes

ABSTRACT

The high mental health problems of adolescents identify the low psychological well-being of adolescents. This research aims to determine whether there are differences in the psychological well-being of adolescents living in orphanage with those living with parents in Padang city, which conducted on August 8th, 2019 to September 12th, 2019. The type of the research is quantitative research with comparative design. The samples of this research are taken by proportional random sampling totaling 185 adolescents living in orphanages and 185 adolescents living with parents by measuring using the Ryff Psychological Well Being Scale questionnaire and analyzed using independent t-test statistical tests. The results showed that psychological well-being of adolescents in orphanages and those living with parents tended to be high with an average score of 175.99 and 175.01. But there was no significant difference between the psychological well-being of adolescents in an orphanage with those living with parents (P value: 0.679). It is expected that parents give responsibilities in the form of scheduled daily activities to adolescents such as cleaning the house.
