

CHAPTER IV

CONCLUSION, LIMITATION, SUGGESTION

4.1 Conclusion

In this research, the relationship between request strategy and the social variables in this research have been analyzed. The data shows that the informants mostly used conventionally indirect request when making a request. The request strategy that frequently produced by the speaker is questioning hearer's ability and willingness. In the data, the researcher found that the social variables give the effect to the requester for choosing appropriate request based on the situation. For the pattern, the researcher found that the internal modifier that frequently used questions and the external modification that often used are the address terms and supportive reason. Those modifiers was happened to make the requests soften and appropriate to the situation.

4.2 Limitation and suggestion

The limitation of the research is the method for collecting the data. The method of collecting the data is written DCT. There are twelve questionnaires in that written DCT in order to know the request strategy that frequently used and the pattern of the request itself. When using written DCT, the researcher could see pragmalinguistics competence only without knowing the sociopragmatics competence in the data. Probably, the next study can use oral DCT or role play to find more natural data. The role-play can help the researcher to know the sociopragmatic competence of the request.
