ANALISIS PELAKSANAAN PROGRAM PEMBERIAN TABLET TAMBAH DARAH PADA REMAJA PUTRI DALAM MENCEGAH ANEMIA DIWILAYAH KERJA PUSKESMAS NARAS KOTA PARIAMAN TAHUN 2020

Viii + 74 halaman, 19 tabel, 7 gambar, 27 lampiran

ABSTRAK

Tujuan

Program pemerintah mengatasi masalah anemia pada remaja belum maksimal penilaian hanya dilihat dari cakupan pendistribusian untuk pemantauan belum berjalan efektif, maka perlu dilakukan analisis pelaksanaan program pemberian tablet tambah darah pada remaja putri dalam mencegah anemia di wilayah kerja Puskesmas Naras Kota Pariaman Tahun 2020.

Metode

Desain penelitian pendekatan kualitatif dengan teknik penentuan informan *purposive sampling* yang dilaksanakan di Puskesmas Naras dengan responden 15 orang. Teknik pengumpulan data berupa wawancara mendalam, observasi, *Focus Group Discussion* dan telaah dokumen berupa profil Puskesmas dan laporan bulanan.

Hasil

Hasil penelitian komponen input berupa kebijakan, sumber daya dan dana sudah sesuai dengan Buku Pedoman, sarana dan prasarana berupa leaflet dan kartu pemantauan masih kurang. Komponen proses, persiapan dan pendistribusian sudah sesuai dengan pedoman, pemantauan, pencatatan dan pelaporan masih belum efektif karena merekap dari kartu pemantauan. Komponen output pada cakupan kegiatan tidak efektif hanya melihat dari pendistribusian, ketepatan sasaran sudah tepat, tingkat kepatuhan tidak dapat dinilai karena kurangnya pemantauan.

Kesimpulan

Analisis yang dilakukan dalam pelaksanaan program pemberian tablet tambah darah belum sepenuhnya berjalan efektif meski pencapaian sudah 100% karena capaian hanya melihat dari cakupan pendistribusian tanpa pemantauan langsung oleh petugas kelurahan.

ANALYSIS OF THE IMPLEMENTATION OF ADDITIONAL TABLET PROGRAMS IN PRINCESS ADOLESCENTS TO PREVENT ANEMIA IN THE HEALTH CENTRE NARAS OF PARIAMAN CITY IN 2020

Viii + 74 pages, 19 tables, 7 pictures, 27 annexes

ABSTRACT

Objective

Government programs to address the problem of anemia in adolescents have not been maximized, only based on the ineffective distribution of surveillance. It is necessary to carry out an analysis of the implementation of additional tablet programs in princess adolescents to prevent anemia in the Health Centre Naras of Pariaman City in 2020

Method

The research design was a qualitative approach using the technique to determine the targeted sample of whistleblowers that was conducted at the Naras Community Health Center with 15 respondents. Data collection techniques include in-depth interviews, observation, focus group discussion, document review in the form of Health Centre profiles, monthly reports.

Results

The results of the input component research in the form of guidelines, resources, resources are in line with the guidelines, facilities, infrastructure in the form of brochures, monitoring cards are still missing. Process, preparation, distribution components comply with the guidelines. Monitoring, recording, reporting is still ineffective as they are taken over by the monitoring card. The output component of the area of activity is not effective if one only looks at the distribution. The accuracy of the target is correct because compliance cannot be assessed due to a lack of monitoring.

Conclusion

The analysis performed when the Blood Pill Supplement Program was implemented was not fully effective, although 100% performance was achieved as the success only affected distribution coverage without direct oversight by field staff.
