*The Relationship between Academic Stress and Sleep Quality in Undergraduate Students of the Faculty of Nursing Unand During Online Learning During a Pandemic*

## ABSTRACT

Online learning makes students experience academic stress. One of the factors that can reduce academic stress is the quality of sleep. The purpose of this study was to determine the relationship between academic stress and sleep quality during online learning. This type of research is a correlation design using a cross sectional approach. Sampling with Stratified Random Sampling technique is 153 students. The research instruments used were the Student Academic Stress Scale (SASS) and the Pittsburgh Sleep Quality Index (PSQI). The data were analyzed using the chi-square test. The results showed that most of the students experienced poor sleep quality, and more than half of the students experienced severe academic stress. The results showed that there was a significant relationship between academic stress and sleep quality during online learning during the pandemic ( $p$  value = 0.00). It is expected that students can get good quality sleep during online learning.
