## **The Contribution of Agroforestry Parak to Farmer's Household Income in Koto Malintang, Tanjung Raya Sub District Agam District**

### **Abstract**

Koto Malintang is an area that has extensive forest are mainly used for agroforestry activities. Agroforestry parak refers to combining agricultural activities with forestry activities. Agroforestry practice can provide a large contribution to the household income of farmers in Koto Malintang. This contribution will also be an indicator to determine whether agroforestry can be continuously practiced in Koto Malintang. This study aimed to describe the management of agroforestry parak and quantify the contribution of agroforestry parak to farmers household income. This research was conducted using a survey method and sampling with a simple random technique. The data analysis used in this research is descriptive qualitative and quantitative. The plants grown in the agroforestry parak in Koto Malintang include durian, surian, bayur, cinnamon, cacao, and areca nut. This study indicates that agroforestry management consists of maintenance, harvesting, and post-harvest (marketing) activities. Maintenance activities include weeding and pruning. Harvesting activities are carried out according to the harvest age of each plant and post-harvest activities are also carried out by marketing activities to direct consumers or collectors. This agroforestry activity has contributed for about 68.54% to the household income of farmers, which means that this activity has a large contribution to the total income of the farmer's household. Farmers should pay more attention to the existence of their forests for the sustainability of agroforestry parak activities in Koto Malintang.
